

News & new proving ground projects

As a pioneering engineering company, Applus IDIADA continues improving its facilities every day. Our state-of-the-art proving ground is constantly evolving by using the latest technologies.

- Dynamic platform C. It is a platform completely flat which is 300m long * 40m wide. This platform is designed for dynamic tests such as slaloms, VDA tests, training courses, confidentiality tests... etc
- Low adherence test hills. Description, characteristics & pictures (see attached document)
- Floodlighting of dynamic platform A, Dynamic platform B and straight line braking surfaces. These three tracks are illuminated all year round from 08:00 to 22:00. Outside of this time period, the clients can do confidentiality testing or they can ask the client services team for more time with illumination of the track
- Track information online. The proving ground department offers a "track information online" service where the clients will see in real time information such as weather conditions, event closures of the tracks, programmed maintenance works, accident situations,... etc
